

PROJECT TITLE – RESTO CITY

ABSTRACT

Although the food sector is the largest retail category in India by a large margin, the industry has not yet widely adopted ecommerce when compared to sectors such as consumer electronics and household products. This is due to the perishable nature of food products, which typically have unique storage and logistic requirements. Quick processing and delivery are critical and have traditionally been a challenge for retailers trying to take advantage of the immense ecommerce opportunity. But recent trends, technology advances, and shopper sentiment indicate that the food ecommerce category is poised for rapid growth. This application is one such service provider which allows a customer to order food online. The system makes the food ordering process standardized, systematic and procedural, avoid arbitrariness, improves the speed and accuracy of sales and manages the time accurately. And also gives the customer their privacy. This app is optimized to fast user experience and checkout.
